

A short paragraph about what I did:

How was each region performance during various years of the Olympics?

The count of whole events that were held in different regions of the world shows that the first 6 regions with the greatest number of Olympic events have been USA, Germany, France, UK, Russia and Canada.

In which year and season, the maximum number of medals were achieved? How many of each medal?

The types of medals and number of each one which were achieved by females and males during different years of the Olympics show that in summer 2008 the number of medals won has reached to its maximum value among all years of the Olympics. In this year, participants could achieve 671 Gold, 667 Silver and 701 Bronze medals.

How was the overall trend of Olympians in some of sports which were be considered in this evaluation?

Overall trend is the increase of the Olympians in all the sports. Swimming has been a popular sport for athletes in most of the Olympics. Rugby was held only in Olympics from 1900 to 1924. Basketball and Beach Volleyball were born in 1936 and 1996, respectively.

The participation of female athletes reached its highest point during the most recent Olympiad (winter 2014 and summer 2016). Males' participation was also reached its highest point in summer 1992 and winter 2016. The overall trend line of both female and male participants was ascending during Olympics.

The other interesting thing about the Olympians was the average of their heights. The minimum and maximum average heights were in Gymnastics and Basketball, respectively.
